

THE “FINE LINES” OF GRAPHING

TYPES OF GRAPHS:

LINE GRAPH — SHOWS CHANGE OVER TIME (RATE)

PIE CHART — SHOWS PERCENTAGE OF A WHOLE

BAR GRAPH — SHOWS UNCHANGING QUANTITIES

1. ALL GRAPHS NEED A **TITLE** — THE TITLE “GRAPH” WILL NOT DO. IT SHOULD EXPLAIN WHAT THE GRAPH REPRESENTS
2. WHERE DO VARIABLES GO? REMEMBER: **DRY-MIX**: PLOT THE **D**EPENDENT, **R**ESPONDING VARIABLE ON THE **Y**-AXIS AND THE **M**ANIPULATED, **I**NDPENDENT VARIABLE ON THE **X**-AXIS.
3. BOTH THE X- AND Y-AXIS **MUST BE LABELED** WITH A DESCRIPTOR AND APPROPRIATE SCALES MUST BE USED. FOR EXAMPLE, DON'T MEASURE THE HEIGHT OF PEOPLE IN MILES! ALL UNITS WILL BE GIVEN A **METRIC** ABBREVIATION WHENEVER POSSIBLE.
4. ALL VALUES (NUMBERS) IN THE GRAPH SHOULD BE LISTED IN A TABLE NEAR THE GRAPH, OR ON A SEPARATE PIECE OF PAPER STAPLED TO THE GRAPH (OR IN THE DATA SECTION OF THE LAB).
5. **USE A RULER** WHEN DRAWING THE AXES AND THE BEST-FIT LINE ON A LINE GRAPH
6. ON A LINE GRAPH ALL DATA POINTS SHOULD BE PLOTTED WITH A DOT. (•).

Height vs. Shoe size

Shoe Size	Average height (cm)
7.0	167.5
8.0	175.0
9.0	182.5
9.5	202.5
10.0	187.5
11.0	195.0
12.0	200.0
